

Avaya Solution & Interoperability Test Lab

# Application Notes for Configuring Avaya Aura ® Communication Server 1000 R7.65, Avaya Aura ® Session Manager 7.0 and Avaya Session Border Controller for Enterprise R7.0 to support BT Global Services SIP Trunk Platform (NOAS) - Issue 0.1

#### Abstract

These Application Notes describe the steps used to configure Session Initiation Protocol (SIP) trunking between BT Global Services SIP Trunk and an Avaya SIP enabled Enterprise Solution. The Avaya solution consists of Avaya Session Border Controller for Enterprise, Avaya Aura® Session Manager and Avaya Communication Server 1000. BT is a member of the DevConnect Service Provider program.

Information in these Application Notes has been obtained through DevConnect compliance testing and additional technical discussions. Testing was conducted via the DevConnect Program at the Avaya Solution and Interoperability Test Lab.

# 1. Introduction

These Application Notes describe the steps used to configure Session Initiation Protocol (SIP) trunking between BT Global Services SIP Trunk and an Avaya SIP-enabled enterprise solution. The Avaya solution consists of the following: Avaya Communication Server 1000 R7.65 (CS1000); Avaya Aura ® Session Manager R7.0 (Session Manager) and Avaya Session Border Controller for Enterprise R7.0 (Avaya SBCE). Note that the shortened names shown in brackets will be used throughout the remainder of the document. Customers using this Avaya SIP-enabled enterprise solution with BT Global Services SIP Trunk are able to place and receive PSTN calls via a dedicated Internet connection and the SIP protocol. This converged network solution is an alternative to traditional PSTN trunks. This approach generally results in lower cost for the enterprise customer.

# 2. General Test Approach and Test Results

The general test approach was to configure a simulated enterprise site using an Avaya SIP telephony solution consisting of Communication Server 10000, Session Manager and Avaya SBCE. The enterprise site was configured to connect to the BT Global Services SIP Trunk Platform.

DevConnect Compliance Testing is conducted jointly by Avaya and DevConnect members. The jointly-defined test plan focuses on exercising APIs and/or standards-based interfaces pertinent to the interoperability of the tested products and their functionalities. DevConnect Compliance Testing is not intended to substitute full product performance or feature testing performed by DevConnect members, nor is it to be construed as an endorsement by Avaya of the suitability or completeness of a DevConnect member's solution.

## 2.1. Interoperability Compliance Testing

The interoperability test included the following:

- Incoming calls to the enterprise site from the PSTN were routed to the DID numbers assigned by BT. Incoming PSTN calls were terminated on Digital, Unistim, SIP and Analog telephones at the enterprise side.
- Outgoing calls from the enterprise site were completed via BT to PSTN telephones. Outgoing calls from the enterprise to the PSTN were made from Digital, Unistim, SIP and Analog telephones.
- Calls using the G.711A and G.729A codecs.
- Fax calls to/from a group 3 fax machine to a PSTN connected fax machine using T.38.
- DTMF transmission using RFC 2833 with successful Voice Mail/Vector navigation for inbound and outbound calls.
- User features such as hold and resume, transfer, conference, call forwarding, etc.
- Caller ID Presentation and Caller ID Restriction.
- Call coverage and call forwarding for endpoints at the enterprise site.
- Transmission and response of SIP OPTIONS messages sent by BT Global Services SIP Trunk Platform requiring Avaya response and sent by Avaya requiring BT response.

### 2.2. Test Results

Interoperability testing of the sample configuration was completed with successful results for BT Global Services SIP Trunk with the following observations:

- The CS1000 default configuration will not allow a blind transfer to be executed (incoming SIP Service Provider trunk to outgoing SIP Service Provider trunk) if the SIP Service Provider in question does not support the SIP UPDATE method. With the installation of plugin 501 on the CS1000, the blind transfer will be allowed and the call will be completed. The limitation of this plugin is that no ringback is provided to the originator of the call for the duration that the destination set is ringing. In addition to plugin 501, it is required that **VTRK SU version "cs1000-vtrk-7.65.16.22.-4.i386.000.ntl"** or higher be used on all SSG signalling servers to ensure proper operation of the blind transfer feature. The use of plugin 501 does not restrict the use of the SIP UPDATE method of blind transfer to other parties that do happen to support the UPDATE method, but rather extends support to those parties that do not. Note that plugin 501 is independent of and does not require the Global Plugin Package 409.
- When testing failover to alternative network SBC, outgoing calls took approximately 32 seconds to set up. A subsequent call did not attempt to set up via the non-operational SBC and was established within an acceptable time though there was no audio. An attempt was made to reduce the initial setup time by reducing SIP timer T1 on the Avaya SBCE but this did not function according to RFC 3261. Fault Report AURORA-7344 was raised to have this investigated by the Avaya SBCE support team.
- The SIP Trunk between the Avaya Galway Lab and the BT Sandbox was unstable and became non-operational several times during testing. This was deemed to be a network issue and not related to the functionality of the BT Global Services SIP Trunk Platform.
- The network responded to an outbound call to an invalid PSTN number with 404 "Service Unavailable-No ports available". This behaviour did not create an issue and a tone was heard on the calling phone. It is noted however, as the commonly used response is 404 "Not Found".
- The BT Sandbox did not have a voicemail system in operation at the time of test. Instead DTMF was successfully tested using IVR.
- There are no mobile phones available on the BT sandbox so Mobile X feature was tested with a fixed phone.
- All unwanted MIME was stripped on outbound calls using the Adaptation Module in Session Manager.
- No inbound toll free numbers were tested as none were available from the Service Provider.
- No Emergency Services numbers tested as test calls to these numbers should be prearranged with the Operator.

#### 2.3. Support

For technical support on BT Global Services products please contact BT Global Services on 0800 028 5314 or visit their website at <u>www.globalservices.bt.com</u>

# 3. Reference Configuration

**Figure 1** illustrates the test configuration. The test configuration shows an Enterprise site connected to BT's SIP Trunk Service. Located at the Enterprise site is an Avaya SBCE, Session Manager and CS1000. Endpoints are Avaya 1140 series IP telephones (with Unistim and SIP firmware), Avaya 1200 series IP telephones (with Unistim and SIP firmware), Avaya Digital telephone, Analog telephone and fax machine. For security purposes, any public IP addresses or PSTN routable phone numbers used in the compliance test are not shown in these Application Notes.

# 5. Configure Avaya Communication Server 1000

This section describes the steps required to configure CS1000 for SIP Trunking and also the basic configuration for telephones (analog, SIP and IP phones). SIP trunks are established between CS1000 and Session Manager. SIP trunks are also established between Session Manager and the Avaya SBCE private interface. The Avaya SBCE public interface connects to the BT Global Services SIP trunks. Incoming PSTN calls from the BT Global Services SIP Trunk service traverse the Avaya SBCE and are directed to the Session Manager, which directs the calls to CS1000E (see **Figure 1**).

When a SIP message arrives at CS1000, further incoming call treatment, such as incoming digit translations and class of service restrictions may be performed. All outgoing calls to the PSTN are processed within CS1000 and may be first subject to outbound features such as route selection, digit manipulation and class of service restrictions. When CS1000 selects a SIP trunk for outgoing PSTN calls, SIP signaling is directed to Session Manager. Session Manager directs the outbound SIP messages to the Avaya SBCE private interface. The Avaya SBCE public interface manages outgoing SIP sessions onwards to the BT Global Services SIP trunks.

Specific CS1000 configuration was performed using Element Manager and the system terminal interface. The general installation of the CS1000, System Manager, Session Manager and Avaya SBCE is presumed to have been previously completed and is not discussed here. Configuration details will be provided as required to draw attention to changes in default system configurations.

## 5.1. Logging into the Avaya Communication Server 1000E

Configuration on the CS1000 will be performed by using both SSH Putty session and Avaya Unified Communications Management GUI.

Log in using SSH to the ELAN IP address of the Call Server with a username containing the correct privileges. Once logged in type **csconsole**, this will take the user into the vxworks shell of the call server. Next type **login**; the user will then be asked to login with correct credentials. Once logged-in the user can then progress to load any overlay.

Log in using the web based Avaya Unified Communications Management GUI. Avaya Unified Communications Management GUI may be launched directly via <u>http://<ipaddress</u>> where the relevant <ipaddress> is the TLAN IP address of the CS1000. Avaya Unified Communications Management can also be implemented on System Manager.

The following screen shows the login screen. Login with the appropriate credentials.

	AVAYA
Use this page to access the server by IP address. You will need to log in again when switching to another server, even if it is in the same security domain. Important: Only accounts which have been previously created in the primary security server are allowed. Expired or reset passwords that normally must be changed during login will fail authentication in this mode (use the link to manual password change instead). Local OS-authenticated User IDs cannot be used. Go to central login for Single Sign-On	User ID: admin Password: Log In Change Password

The Avaya Unified Communications Management **Elements** page will be used for configuration. Click on the Element Name corresponding to CS1000E in the Element Type column. In the abridged screen below, the user would click on the Element Name **EM on cs1kvl9**.

Elements				
New elements are registered into the set optionally filter the list by entering a sea		d as simple hyperlinks. C	Click an element name to launch its man	nagement service. You can
(S	earch Reset			
Add Edil Delete				<u>∎</u> ⊕
Element Name	Element Type	Release	Address	Description
1 smgrv9.avaya.com (primary)	Base OS	7.6	10.10.9.57	Base OS element.
2 EM on cs1kvl9	CS1000	7.6	192.168.27.2	New element.
3 cs1kvl9.avaya.com (member)	Linux Base	7.6	86.47.122.35	Base OS element
				Server metric.
4 192.168.27.3	Media Gateway Controller	7.6	192.168.27.3	New element.

## 5.2. Confirm System Features

The keycode installed on the Call Server controls the maximum values for these attributes. If a required feature is not enabled or there is insufficient capacity, contact an authorized Avaya sales representative to add additional capacity. Use the CS1000 system terminal and manually load overlay 22 to print the System Limits (the required command is **slt**), and verify that the number of SIP Access Ports reported by the system is sufficient for the combination of trunks to the BT Global Services network, and any other SIP trunks needed. See the following screenshot for a typical System Limits printout. The value of **SIP ACCESS PORTS** defines the maximum number of SIP trunks for the CS1000.

System type is - Commun	nication	Server	1000/0	CP PM		
CP PM - Pentium M 1.4 (	GHz					
IPMGs Registered:		4				
IPMGs Unregistered:		0				
IPMGs Configured/unreg	istered:	2				
TRADITIONAL TELEPHONES		LEFT	110	USED	10	
DECT USERS	16	LEFT	16	USED	0	
	10000	LEFT	9954	USED	46	
BASIC IP USERS	16	LEFT	13	USED	3	
TEMPORARY IP USERS	8	LEFT	8	USED	0	
DECT VISITOR USER	16	LEFT	16	USED	0	
ACD AGENTS	192	LEFT	185	USED	7	
MOBILE EXTENSIONS	8	LEFT	7	USED	1	
TELEPHONY SERVICES	16	LEFT	13	USED	3	
CONVERGED MOBILE USERS	8	LEFT	8	USED	0	
AVAYA SIP LINES	16	LEFT	12	USED	4	
THIRD PARTY SIP LINES	16	LEFT	16	USED	0	
PCA	20	LEFT	18	USED	2	
ITG ISDN TRUNKS	0	LEFT	0	USED	0	
H.323 ACCESS PORTS	524	LEFT	524	USED	0	
AST	6652	LEFT	6640	USED	12

SIP CTI TR87	16	LEFT	8	USED	8	
SIP ACCESS PORTS	524	LEFT	518	USED	6	
RAN CON	90	LEFT	90	USED	0	
MUS CON	120	LEFT	120	USED	0	

Load Overlay 21 and confirm the customer is setup to use ISDN trunks by typing the PRT and NET\_DATA commands as shown below.

REQ: prt TYPE: net TYPE NET\_DATA CUST 0 TYPE NET\_DATA CUST 00 OPT RTD AC1 INTL NPA SPN NXX LOC AC2 FNP YES ISDN YES

## 5.3. Configure Codecs for Voice and FAX operation

BT Global Service's SIP Trunk supports G.711A and G.729 voice codecs. Using the CS1000 Element Manager sidebar, select **Nodes**, Servers, Media Cards. Navigate to the IP Network  $\rightarrow$  IP Telephony Nodes  $\rightarrow$  Node Details  $\rightarrow$  VGW and Codecs property page and configure the CS1000 General codec settings as in the following screenshots. The values highlighted are required for correct operation. The following screenshot shows the necessary General settings.

Move down to the Voice Codecs section and configure the G.711 codec settings. The following screenshot shows the G.711 codec settings.

System » IP Network » IP Telephony Nodes » Node Details » Vo		d Co	decs			
Node ID: 200 - Voice Gateway (VGW) and Codec	5					
General   Voice Codecs   Fax						
Voice Codecs						-
Codec G711: 📝 Enab	led (r	equ	ired)			
Voice payload size:	20	•	(millised	ond	s per frame)	
Voice playout (jitter buffer) delay:	40	•	80	•	(milliseconds)	
	Nomi	nal	Maxim	um		
	Maxin settin		delay	may	y be automatically adjusted based on nominal	E
	III V	oico	Activity	Do	etection (VAD)	

Next, scroll down to the G.729 codec section and configure the settings.

Managing: 192.168.27.2 Username: admin System » IP Network » IP Telephony Nodes » Node Details » V Node ID: 200 - Voice Gateway (VGW) and Coded	A CARACTER CONTRACTOR CONTRACTOR	
General   Voice Codecs   Fax		
Codec G729: 📝 Enal Voice payload size:	bled 20 • (milliseconds per frame)	*
Voice playout (jitter buffer) delay	: 40 • 80 • (milliseconds) Nominal Maximum Maximum delay may be automatically adjusted based on nominal settings.	
	Voice Activity Detection (VAD)	

Finally, configure the Fax settings as in the highlighted section of the next screenshot. Click on the **Save** button when finished.

Codec name:	T.38 FA	K	
Maximum rate:	14400	▼ (bps)	
Fax TCF method:	2 🔻		
Fax playout nominal delay:	100	(0 - 300 milliseconds)	
FAX no activity timeout:	20	(10 - 32000 milliseconds)	
Pac	:ket size:	30 • (bps)	

### 5.4. Virtual Trunk Gateway Configuration

Use CS1000 Element Manager to configure the system node properties. Navigate to the **System**   $\rightarrow$  IP Networks  $\rightarrow$  IP Telephony Nodes  $\rightarrow$  Node Details and verify the highlighted section is completed with the correct IP addresses and subnet masks of the Node. The call server and signaling server have previously been configured with IP addresses. The Node IPv4 address is the IP address that the IP phones use to register. This is also where the SIP trunk connection is made to Session Manager. When an entity link is added in Session Manager for the CS1000, it is the Node IPv4 address that is used (see Section 6.5 – Define SIP Entities for more details).

Node ID:	200	* (0-9999)			
all server IP address:	192.168.27.2	*	TLAN address type:	IPv4 only	
				IPv4 and IPv6	
mbedded LAN (ELAN)			Telephony LAN (TLAN)		
Gateway IP address:	192.168.27.1	*	Node IPv4 address:	10.10.9.21	*
Subnet mask:	255.255.255.0	*	Subnet mask:	255.255.255.0	
			Node IPv6 address:		
IP Teleph	iony Node Propert	ies	Applica	tions (click to edit	configuration)
<u>Voice Gateway (VG)</u> Ouglity of Service (C			<u>SIP Line</u> Terminal Pro	oxy Server (TPS)	
Quality of Service (C     LAN	203)		<ul> <li><u>Gateway (SII</u>)</li> </ul>		
<u>SNTP</u>			Children and Chi	rectories (PD)	
Numbering Zones	outing Treatment (		<ul> <li>Presence Pu</li> <li>IP Media Ser</li> </ul>		

The next two screenshots show the SIP Virtual Trunk Gateway configuration, navigate to System  $\rightarrow$  IP Networks  $\rightarrow$  IP Telephony Nodes  $\rightarrow$  Node Details  $\rightarrow$  Gateway (SIPGW) Virtual Trunk Configuration Details and fill in the highlighted areas with the relevant settings.

- Vtrk gateway application: Provides option to select Gateway applications. The three supported modes are SIP Gateway (SIPGw), H.323Gw, and SIPGw and H.323Gw
- **SIP domain name:** The SIP domain name is the SIP Service Domain. The SIP domain name configured in the Signaling Server properties must match the Service Domain name configured in Session Manager; in this case **avaya.com**
- Local SIP port: The Local SIP Port is the port to which the gateway listens. The default value is **5060**
- **Gateway endpoint name:** This field cannot be left blank so a value is needed here. This field is used when a Network Routing Server is used for registration of the endpoint. In this network a Session Manager is used so any value can be put in here and will not be used
- Application node ID: This is a unique value that can be alphanumeric and is for the new Node that is being created, in this case 200
- **Proxy or Redirect Server:** Primary TLAN IP address is the Security Module IP address of Session Manager. The **Transport protocol** used for **SIP**, in this case is **TCP**
- **SIP URI Map: Public E.164 National** and **Private Unknown** are left blank. All other fields in the SIP URI Map are left with default values

## 5.5. Configure Bandwidth Zones

Bandwidth Zones are used for alternate call routing between IP stations and for bandwidth management. SIP trunks require a unique zone, not shared with other resources and best practice dictates that IP telephones and Media Gateways are all placed in separate zones. In the sample configuration SIP trunks use zone 01 and IP and SIP Telephones use zone 02; system defaults were used for each zone other than the parameter configured for **Zone Intent**. For SIP Trunks (zone 01), **VTRK** is configured for **Zone Intent**. For IP, SIP Telephones (zone 02), **MO** is configured for **Main Office**.

Use Element Manager to define bandwidth zones as in the following highlighted example. Use Element Manager and navigate to **System**  $\rightarrow$  **IP** Network  $\rightarrow$  **Zones**  $\rightarrow$  **Bandwidth Zones** and add new zones as required.

## 5.6. Configure Incoming Digit Conversion Table

A limited number of Direct Dial Inwards (DDI) numbers were available. The Incoming Digit Conversion (IDC) table was configured to translate incoming PSTN numbers to four digit local telephone extension numbers. The digits of the actual PSTN DDI number are obscured for security reasons. The following screenshot shows the incoming PSTN numbers converted to local extension numbers. These were altered during testing to map to various SIP, Analog, Digital or UNIStim telephones depending on the particular test case being executed.

## 5.7. Configure SIP Trunks

CS1000 virtual trunks will be used for all inbound and outbound PSTN calls to the BT Global Services SIP Trunk service. Six separate steps are required to configure CS1000 virtual trunks:

- Configure a D-Channel Handler (**DCH**); configure using the CS1000 system terminal and overlay 17
- Configure a SIP trunk Route Data Block (**RDB**); configure using the CS1000 system terminal and overlay 16
- Configure SIP trunk members; configure using the CS1000 system terminal and overlay 14
- Configure a Digit Manipulation Data Block (**DGT**), configure using the CS1000 system terminal and overlay 86
- Configure a Route List Block (**RLB**); configure using the CS1000 system terminal and overlay 86
- Configure Co-ordinated Dialling Plan(s) (CDP); configure using the CS1000 system terminal and overlay 87

The following is an example DCH configuration for SIP trunks. Load **Overlay 17** at the CS1000 system terminal and enter the following values. The highlighted entries are required for correct SIP trunk operation. Exit overlay 17 when completed.

<b>Overlay</b>	17
ADAN	DCH
СТҮР	DCIP
DES	VIR_TR
USR	ISLD
ISLM	4000

NASA	YES
IFC	SL1
CNEG	1
RLS	ID 4
RCAP	ND2
MBGA	NO
Н323	
OVI	LR NO
OVI	LS NO

Next, configure the SIP trunk Route Data Block (RDB) using the CS1000 system terminal and overlay 16. Load **Overlay 16**, enter **RDB** at the prompt, press return and commence configuration. The value for **DCH** is the same as previously entered in overlay 17. The value for **NODE** should match the node value in **Section 5.4**. The value for **ZONE** should match that used in **Section 5.5** for **VTRK**. The remaining highlighted values are important for correct SIP trunk operation.

Next, configure virtual trunk members using the CS1000 system terminal and **Overlay 14**. Configure sufficient trunk members to carry both incoming and outgoing PSTN calls. The following example shows a single SIP trunk member configuration. Load **Overlay 14** at the system terminal and type **new X**, where X is the required number of trunks. Continue entering data until the overlay exits. The **RTMB** value is a combination of the **ROUT** value entered in the previous step and the first trunk member (usually 1). The remaining highlighted values are important for correct SIP trunk operation.

Next, configure a Digit Manipulation data block (DGT) in overlay 86. Load **Overlay 86** at the system terminal and type **new**. The following example shows the values used. **Note: ISPN** is set to **0** as BT Global Services required a prefix of 0 to be inserted before the dialed number for outbound calls. The value for Digit Manipulation Index (**DMI**) is the same as when inputting the **DMI** value during configuration of the Route List Block.

### 5.8. Calling Line Identification

This section documents basic configuration relevant to the BT Global Services configuration. Load Overlay 15 at system terminal and enter the required values in bold. As shown below, CLID is set to YES and ENTRY is set to 0. HNTN and HLCL match the required digits assigned by BT Global Services and DIDN is set to NO.

Load Overlay 15 TYPE NET DATA CUST 0 OPT AC2 FNP CLID YES SIZE INTL ENTRY 0 HNTN 07689 ESA HLCL ESA INHN NO ESA APDN NO HLCL 11010 DIDN NO DIDN LEN O HLOC LSC CLASS FMT DN

### 5.9. Configure Analog, Digital and IP Telephones

A variety of telephone types were used during the testing, the following is the configuration for the Avaya 1140e UNIStim IP telephone. Load **Overlay 20** at the system terminal and enter the following values. A unique four digit number is entered for the **KEY 00**. The value for **CFG\_ZONE** is the value used in **Section 5.5** for IP and SIP Telephones.

```

Analog telephones are also configured using overlay 20; the following example shows an analog port configured for Plain Ordinary Telephone Service (POTS) and also configured to allow fax transmission. A unique value is entered for **DN**, this is the extension number. **DTN** is required if the telephone uses DTMF dialing. Values **FAXA** and **MPTD** configure the port for T.38 Fax transmissions.

### 5.10.Configure the SIP Line Gateway Service

SIP terminal operation requires the CS1000 node to be configured as a SIP Line Gateway (SLG) before SIP telephones can be configured. Prior to configuring the SIP Line node properties, the SIP Line service must be enabled in the customer data block. Use the CS1000 system terminal and overlay 15 to activate SIP Line services (SLS\_DATA), as in the following example where **SIPL\_ON** is set to **YES**.

SLS_DATA	
SIPL_ON YES	
UAPR 11	
NMME NO	

If a numerical value is entered against the **UAPR** setting, this number will be pre appended to all SIP Line configurations, and is used internally in the SIP Line server to track SIP terminals. Use Element Manager and navigate to the **IP Network**  $\rightarrow$  **IP Telephony Nodes**  $\rightarrow$  **Node Details**  $\rightarrow$  **SIP Line Gateway Configuration** page. See the following screenshot for highlighted critical parameters.

- **SIP Line Gateway Application:** Enable the SIP line service on the node, check the box to enable
- SIP Domain Name: The value must match that configured in Section 6.2
- **SLG endpoint name:** The endpoint name is the same endpoint name as the SIP Line Gateway and will be used for SIP gateway registration
- SLG Local Sip port: Default value is 5070
- SLG Local TLS port: Default value is 5071

SIP domain name:	avaya.com	ż	Monitor IP addresses (listed below)
SLG endpoint name:	cs1kvl9		Information will be captured for the IP addresses listed below.
SLG Group ID:			Monitor IP: Add
SLG Local Sip port:	5070	(1 - 65535)	Monitor addresses:
SLG Local TIs port:	5071	(1 - 65535)	Remove

#### 5.1. Configure SIP Line Telephones

When SIP Line service configuration is completed, use the CS1000 system terminal and **Overlay 20** to add a Universal Extension (UEXT). See the following example of a SIP Line extension. The value for **UXTY** must be **SIPL**. This example is for an Avaya SIP telephone, so the value for **SIPN** is 1. The **SIPU** value is the username, **SCPW** is the logon password and these values are required to register the SIP telephone to the SLG. The value for **CFG\_ZONE** is the value used in **Section 5.5** for IP and SIP Telephones. A unique telephone number is entered for value **KEY 00**. The value for **KEY 01** is comprised of the **UAPR** (set in **Section 5.8**) value and the telephone number used in **KEY 00**.

Database backup Complete!
TEMU207
Backup process to local Removable Media Device ended successfully.

## 6. Configuring Avaya Aura® Session Manager

This section provides the procedures for configuring Session Manager. Session Manager is configured via System Manager. The procedures include the following areas:

- Log in to Avaya Aura<sup>®</sup> System Manager.
- Administer SIP Domain.
- Administer SIP Location.
- Administer Adaptations.
- Administer SIP Entities.
- Administer Entity Links.
- Administer Routing Policies.
- Administer Dial Patterns.

It may not be necessary to create all the items above when creating a connection to the service provider since some of these items would have already been defined as part of the initial Session Manager installation. This includes items such as certain SIP domains, locations, SIP entities, and Session Manager itself. However, each item should be reviewed to verify the configuration.

#### 6.1. Log in to Avaya Aura® System Manager

Access the System Manager using a Web Browser by entering **http://<FQDN >/SMGR**, where **<FQDN>** is the fully qualified domain name of System Manager. Log in using appropriate credentials (not shown) and the **Home** tab will be presented with menu options shown below.

VA tem Manager 7.0		Last Logged on at October 1, Log
, Users	di Elements	Q, Services
Administrators	Communication Manager	Backup and Restore
Directory Synchronization	Communication Server 1000	Bulk Import and Export
Groups & Roles	Conferencing	Configurations
User Management	Engagement Development Platform	Events
User Provisioning Rule	IP Office	Geographic Redundancy
	Media Server	Inventory
	Meeting Exchange	Licenses
	Messaging	Replication
	Presence	Reports
	Routing	Scheduler
	Session Manager	Security
	Work Assignment	Shutdown
		Solution Deployment Manager
		Templates
		Tenant Management

Most of the configuration items are performed in the Routing Element. Click on **Routing** in the Elements column shown above to bring up the **Introduction to Network Routing Policy** screen.

AVAYA Aura <sup>®</sup> System Manager 7.0	Last Log	ged on at October 1, 2015 9:15 AM
Home Routing X		
▼ Routing	Home / Elements / Routing	0
Domains Locations	Introduction to Network Routing Policy	Help ?
Adaptations	Network Routing Policy consists of several routing applications like "Domains", "Locations", "SIP Entities", etc.	
SIP Entities	The recommended order to use the routing applications (that means the overall routing workflow) to configure your network configuration is as follows:	
Entity Links	Step 1: Create "Domains" of type SIP (other routing applications are referring domains of type SIP).	
Time Ranges	Step 2: Create "Locations"	
Routing Policies	Step 3: Create "Adaptations"	
Dial Patterns	Step 4: Create "SIP Entities"	
Regular Expressions	- SIP Entities that are used as "Outbound Proxies" e.g. a certain "Gateway" or "SIP Trunk"	
Defaults	- Create all "other SIP Entities" (Session Manager, CM, SIP/PSTN Gateways, SIP Trunks)	
	- Assign the appropriate "Locations", "Adaptations" and "Outbound Proxies"	

## 6.2. Administer SIP Domain

Create a SIP domain for each domain for which Session Manager will need to be aware in order to route calls. Expand **Elements**  $\rightarrow$  **Routing** and select **Domains** from the left navigation menu, click **New** (not shown). Enter the following values and use default values for remaining fields.

- Name Enter a Domain Name. In the sample configuration, avaya.com was used.
- **Type** Verify **SIP** is selected.
- Notes Add a brief description [Optional].

Click **Commit** to save. The screen below shows the SIP Domain defined for the sample configuration.

			Help
Domain Management			
New Edit Delete Duplicate More Actions •			
Item 🥲			Filter: Enable
Name	Туре	Notes	
avaya.com	sip		
		Notes	

#### 6.3. Administer Locations

Locations can be used to identify logical and/or physical locations where SIP Entities reside for purposes of bandwidth management and call admission control. To add a location, navigate to **Routing**  $\rightarrow$ **Locations** in the left-hand navigation pane and click the **New** button in the right pane (not shown). In the **General** section, enter the following values. Use default values for all remaining fields:

- **Name:** Enter a descriptive name for the location.
- **Notes:** Add a brief description (optional).

The Location Pattern is used to identify call routing based on IP address. Session Manager matches the IP address against the patterns defined in this section. If a call is from a SIP Entity that does not match the IP address pattern then Session Manager uses the location administered for the SIP Entity.

In the Location Pattern section, click Add and enter the following values.

- **IP Address Pattern** Enter the logical pattern used to identify the location.
- Notes Add a brief description [Optional].

Click **Commit** to save. The screenshot below shows the Location **SM\_7** defined for the compliance testing.

Home / Elements / Routing / Locations

* 10.10.3.*				
* 10.10.8.*				
Select : All, None				
		Commit Cancel		

#### 6.4. Administer Adaptations

Adaptations can be used to modify the called and calling party numbers to meet the requirements of the service. The called party number present in the SIP INVITE Request URI is modified by the **Digit Conversion** in the Adaptation. The example below was applied to the Avaya SBCE SIP Entity and was used in test to convert numbers being passed between the Avaya SBCE and Session Manager.

To add an adaptation, under the **Routing** tab select **Adaptations** on the left hand menu and then click on the **New** button (not shown). Under **Adaptation Details**  $\rightarrow$  **General**:

- In the Adaptation Name field enter an informative name.
- In the **Module Name** field click on the down arrow and then select the <**click to add module**> entry from the drop down list and type **DigitConversionAdapter** in the resulting **New Module Name** field.
- Module parameter MIME =no Strips MIME message bodies on egress from Session Manager

fromto=true Modifies from and to headers of a message

4	Home / Elements / Routing / Adaptations		2
	Adaptation Details	Commit Cancel	
	General		
	* Adaptation Name:	BTG	
	* Module Name:	DigitConversionAdapter	
	Module Parameter Type:	Name-Value Parameter 💌	
		Add Remove	
		Name         Value	
		Fromto true	
		MIME no *	ļ
		Select : All, None	
	Egress URI Parameters:		
	Notes:		

Scroll down the page and under **Digit Conversion for Incoming Calls to SM**, click the **Add** button and specify the digit manipulation to be performed as follows:

- Enter the leading digits that will be matched in the Matching Pattern field.
- In the **Min** and **Max** fields set the minimum and maximum digits allowed in the digit string to be matched.
- In the **Delete Digits** field enter the number of leading digits to be removed.
- In the **Insert Digits** field specify the digits to be prefixed to the digit string.
- In the **Address to modify** field specify the digits to manipulate by the adaptation. In this configuration the dialed number is the target so **both** have been selected.

Add	Remove	r Incomi	ng Calls	to SM						
1 Iter	n @								Filt	t <mark>er:</mark> Enable
	Matching Pattern	🔺 Min	Max	Phone Context	Delete Digits	Insert Digits	Address to modify	Adaptation Data	Notes	
1	* +44	* 3	* 15		* 1		both 💌			
Selec	: All, None									

This will ensure any incoming numbers matching +44 will have the + digit removed before being presented to the Communication Server 1000.

In the **Digit Conversion for Outgoing Calls to SM** section, click **Add** and enter the following values.

- Enter the leading digits that will be matched in the Matching Pattern field.
- In the **Min** and **Max** fields set the minimum and maximum digits allowed in the digit string to be matched.
- In the **Delete Digits** field enter the number of leading digits to be removed.
- In the **Insert Digits** field specify the digits to be prefixed to the digit string.
- In the **Address to modify** field specify the digits to manipulate by the adaptation. In this configuration the dialed number is the target so **both** have been selected.

Add	Remove								
Iter	ns 🥲		1						Filter: Ena

	* 6001	* 4	* 4		* 4	055xxxxxx01	both 💌		
1	* 6002	* 4	* 4		* 4	055xxxxx02	both 💌		
						III			
elect	: All, None								

This will ensure any destination numbers beginning with 6 with have a specified CLID presented on outbound calls.

#### 6.5. Administer SIP Entities

A SIP Entity must be added for each SIP-based telephony system supported by a SIP connection to Session Manager. To add a SIP Entity, select **SIP Entities** on the left panel menu and then click on the **New** button (not shown). The following will need to be entered for each SIP Entity. Under **General**:

- In the **Name** field enter an informative name
- In the **FQDN or IP Address** field enter the IP address of Session Manager or the signalling interface on the connecting system
- In the **Type** field use **Session Manager** for a Session Manager SIP Entity, **Other** for a Communication Server 1000 SIP Entity and **SIP Trunk** for the Avaya SBCE SIP Entity
- In the **Location** field select the appropriate location from the drop down menu
- In the **Time Zone** field enter the time zone for the SIP Entity

In this configuration there are three SIP Entities.

- Session Manager SIP Entity
- Communication Server 1000 SIP Entity
- Avaya SBCE SIP Entity

#### 6.5.1. Avaya Aura® Session Manager SIP Entity

The following screens show the SIP entity for Session Manager. The **FQDN or IP Address** field is set to the IP address of the Session Manager SIP signalling interface and **Type** is **Session Manager**. Set the **Location** to that defined in **Section 6.3** and the **Time Zone** to the appropriate time.

IP Entity Details			Commit Cancel
andra - that day a constant			
General			
	* Name:	Session Manager	
	* FQDN or IP Address:	10.10.9.31	
	Туре:	Session Manager

	Credential name:		
SIP Link Monitoring			

Session Manager must be configured with the port numbers on the protocols that will be used by the other SIP entities. To configure these scroll to the bottom of the page and under **Port**, click **Add**, then edit the fields in the resulting new row.

- In the **Port** field enter the port number on which the system listens for SIP requests.
- In the **Protocol** field enter the transport protocol to be used for SIP requests.
- In the **Default Domain** field, from the drop down menu select the domain added in **Section 6.2** as the default domain.

#### 6.5.1.1 Avaya Aura® Communication Server 1000 SIP Entity

The following screen shows the SIP entity for CS1000. The **FQDN or IP Address** field is set to the IP address of the interface on CS1000 that will be providing SIP signalling and **Type** is **Other**. Set the **Location** to that defined in **Section 6.3** and the **Time Zone** to the appropriate time.

SIP Entity Details	Commit Cancel

# 6.6. Administer Entity Links

A SIP trunk between a Session Manager and another system is described by an Entity Link. To add an Entity Link, select **Entity Links** on the left panel menu and click on the **New** button (not shown). Fill in the following fields in the new row that is displayed.

- In the **Name** field enter an informative name.
- In the **SIP Entity 1** field select **Session Manager**.
- In the **Protocol** field enter the transport protocol to be used to send SIP requests.
- In the **Port** field enter the port number to which the other system sends its SIP requests.
- In the **SIP Entity 2** field enter the other SIP Entity for this link, created in **Section 6.4**.
- In the **Port** field enter the port number to which the other system expects to receive SIP requests.
- Select **Trusted** from the drop-down menu to make the other system trusted.

Click **Commit** to save changes. The following screenshot shows the Entity Links used in this configuration.

int	ity Links									Help

# 6.7. Administer Routing Policies

Routing policies must be created to direct how calls will be routed to a system. To add a routing policy, select **Routing Policies** on the left panel menu and then click on the **New** button (not shown).

Under General:

- Enter an informative name in the Name field
- Under **SIP Entity as Destination**, click **Select**, and then select the appropriate SIP entity to which this routing policy applies
- Under **Time of Day**, click **Add**, and then select the time range

The following screen shows the routing policy for CS1000.

# 6.8. Administer Dial Patterns

A dial pattern must be defined to direct calls to the appropriate telephony system. To configure a dial pattern select **Dial Patterns** on the left panel menu and then click on the **New** button (not shown).

Under General:

- In the **Pattern** field enter a dialled number or prefix to be matched.
- In the **Min** field enter the minimum length of the dialled number.
- In the **Max** field enter the maximum length of the dialled number.
- In the **SIP Domain** field select **ALL** or alternatively one of those configured in **Section 6.2**.

#### Under Originating Locations and Routing Policies:

- Click **Add**, in the resulting screen (not shown).
- Under Originating Location, select the location defined in Section 6.3 or ALL.
- Under **Routing Policies** select one of the routing policies defined in **Section 6.6**.
- Click **Select** button to save.

# 7. Configure Avaya Session Border Controller for Enterprise

This section describes the configuration of the Avaya Session Border Controller for Enterprise (Avaya SBCE). The Avaya SBCE provides security and manipulation of signalling to provide an interface to the Service Provider's SIP Trunk that is standard where possible and adapted to the Service Provider's SIP implementation where necessary.

# 7.1. Access Avaya Session Border Controller for Enterprise

Access the Session Border Controller using a web browser by entering the URL https://<ip-address>, where <ip-address> is the private IP address configured at installation. A log in screen is presented.

AVAYA	Log In Username:
Session Border Controller for Enterprise	Continue This system is restricted solely to authorized users for legitimate business purposes only. The actual or attempted unauthorized access, use or modifications of this system is strictly prohibited. Unauthorized users are subject to company disciplinary procedures and or criminal and civil penalties under state, federal or other applicable domestic and foreign laws.
	The use of this system may be monitored and recorded for administrative and security reasons. Anyone accessing this system expressly consents to such monitoring and recording, and is advised that if it reveals possible evidence of criminal activity, the evidence of such activity may be provided to law enforcement officials.
	All users must comply with all corporate instructions regarding the protection of information assets.
	© 2011 - 2015 Avaya Inc. All rights reserved.

Once logged in, a dashboard is presented with a menu on the left-hand side. The menu is used as a starting point for all configuration of the Avaya SBCE.

### 7.2. Define Network Management

Network information is required on the Avaya SBCE to allocate IP addresses and masks to the interfaces. Note that only the **A1** and **B1** interfaces are used, typically the **A1** interface is used for the internal side and **B1** is used for external. Each side of the Avaya SBCE can have only one interface assigned.

To define the network information, navigate to **Device Specific Settings**  $\rightarrow$  **Network Management** in the main menu on the left hand side and click on Add.

Session Borde	er Controller	for Enterp	rise				A	ЛАУА
Dashboard Administration	Network Manage	ement: GSSCP_\	/9					
Backup/Restore	Devices	Interfaces Net	vorks					
System Management		Interfaces	VOTKS					
Global Parameters	GSSCP_V9							Add
Global Profiles		Name	Gateway	Subnet Mask	Interface	IP Address		
PPM Services		Internal	10.10.9.1	255.255.255.0	A1	10.10.9.71	Edit	Delete
Domain Policies		External	192,168,122,9	255,255,255,128	B1	192,168,122,57	Edit	Delete

Device Specific Settings								
Network Management								

Enter details for the external interface in the dialogue box:

- Enter a descriptive name in the **Name** field.
- Enter the default gateway IP address for the external interface in the **Default Gateway** field.
- Enter the subnet mask in the **Subnet Mask** field.
- Select the external interface to be used from the **Interface** drop down menu. In the test environment, this was **B1**.
- Click on Add and an additional row will appear allowing an IP address to be entered.
- Enter the external IP address in the IP Address field and leave the Public IP and Gateway Override fields blank.
- Click on **Finish** to complete the interface definition.

Session Border Controller for Enterprise

<ul> <li>TLS Management</li> <li>Device Specific Settings</li> </ul>		B1		Enabled	
Network Management		B2		Disabled	

**Note:** to ensure that the Avaya SBCE uses the interfaces defined, the Application must be restarted.

- Click on **System Management** in the main menu (not shown).
- Select **Restart Application** indicated by an icon in the status bar (not shown).

## 7.3. Define Interfaces

When the IP addresses and masks are assigned to the interfaces, these are then configured as signalling and media interfaces. Testing was carried out with TCP used for transport of signalling between the Session Manager and the Avaya SBCE, and UDP for transport of signalling between the Avaya SBCE and the BT Global Services SIP Trunk. This document shows the configuration for TCP and UDP, if additional security is required, it's recommended to use TLS and port 5061.

### 7.3.1. Signalling Interfaces

To define the signalling interfaces on the Avaya SBCE, navigate to **Device Specific Settings**  $\rightarrow$  **Signaling Interface** (not shown) in the main menu on the left hand side. Details of transport protocol and ports for the external and internal SIP signalling are entered here.

- Select Add and enter details of the external signalling interface in the pop-up menu.
- In the Name field enter a descriptive name for the external signalling interface.
- In the **IP Address** drop down menus, select the external network interface and IP address. Note that when the external network interface is selected, the bottom drop down menu is populated with the available IP addresses as defined in **Section 7.2**. In the test environment, this was a single IP address **192.168.122.57**.
- Enter the UDP port number in the **UDP Port** field, **5060** is used for the BT Global Services SIP Trunk.

Session Border Controller for Enterprise				
			Add Signaling Interface	X
Dashboard	Signaling Interface:	Name	External	
Administration Backup/Restore System Management	Devices	IP Address	External (B1, VLAN 0)

	External	192.168.122.57 External (B1, VLAN 0)		5060		None	Edit Delete

The following screenshot shows details of the signalling interfaces:

Note. In the test environment, the internal IP address was 10.10.9.71.

#### 7.3.2. Media Interfaces

To define the media interfaces on the Avaya SBCE, navigate to **Device Specific Settings**  $\rightarrow$  **Media Interface** in the main menu on the left hand side. Details of the RTP and SRTP port ranges for the internal and external media streams are entered here. The IP addresses for media can be the same as those used for signalling.

- Select **Add** and enter details of the external media interface in the pop-up menu.
- In the **Name** field enter a descriptive name for the external media interface.
- In the **IP Address** drop down menus, select the external network interface and IP address. Note that when the external network interface is selected, the bottom drop down menu is populated with the available IP addresses as defined in **Section 7.2**. In the test environment, this was a single IP address **192.168.122.57**.
- Define the RTP **Port Range** for the media path with BT Global Services SIP Trunk, during testing this was left at the default values.

Dashboard Administration	Media Interface: G	SSCP_V9	
Backup/Restore	Devices		Add Media Interface X
System Management	GSSCP V9

The following screenshot shows details of the media interfaces:

### 7.4. Define Server Interworking

Server interworking is defined for each server connected to the Avaya SBCE. In this case, BT Global Services SIP Trunk is connected as the Trunk Server and the Session Manager is connected as the Call Server.

To define server interworking on the Avaya SBCE, navigate to **Global Profiles**  $\rightarrow$  **Server Interworking** in the main menu on the left hand side. To define Server Interworking for the Session Manager, click on **Add** (not shown). A pop-up menu (not shown) is generated. In the **Name** field enter a descriptive name for the Session Manager and click **Next**.

## 7.5. Define Servers

A server definition is required for each server connected to the Avaya SBCE. In this case, BT Global Services SIP Trunk is connected as the Trunk Server and the Session Manager is connected as the Call Server. To define the BT Global Services SIP Trunk Server, navigate to **Global Profiles** → Server Configuration in the main menu on the left hand side. Click on Add and enter an appropriate name in the pop-up menu (not shown). Click on Next and enter details in the dialogue box.

- In the Server Type drop down menu, select Trunk Server.
- Click on Add to enter an IP address
- In the **IP Addresses / FQDN** box, type the first BT Global Services network SBC interface address.
- In the **Port** box, enter the port to be used for the SIP Trunk. This was left blank during testing which defaults to 5060 when UDP is used for transport.
- In the **Transport** drop down menu, select **UDP**.
- Click on Add and repeat the above for the alternative network SBC. Click on Next.

Alarms Incidents Stat	us ~	Logs ~	Diagnostics	Users						
Session Bor	der	Cont	roller f	or Enterpri	ise					
Backup/Restore System Management ▹ Global Parameters	^	Server	Configurati	on: BT_Trunk	Edit Server Configu	ration Profile -	General			x

Back Next		Back		

Solution & Interoperability Test Lab Application Notes ©2015 Avaya Inc. All Rights Reserved. 51 of 74 BTGS\_CS1K76\_SM **Note**: Although the Heartbeat configuration was left at default values for most of the testing, the screenshot shows values used when verifying the SIP Trunk. For details, refer to **Section 9**.

The final dialogue box is the **Advanced** settings:

- In the **Interworking Profile** drop down menu, select the **Interworking Profile** for the BT Global Services SIP Trunk defined in **Section 7.4**.
- Click Finish.

Add Serve	er Configuration Profile - Advanced	X
Enable DoS Protection		
Enable Grooming		
Interworking Profile	BT V	
Signaling Manipulation Script	None 🗸	
Connection Type	SUBID V	
Securable		
	Back	

BT Global Services use two network SBCs for resilience. A separate Trunk Server configuration is required for the alternative SBCs. Repeat the above process using the IP address of the alternative SBC, in the test environment this was 192.168.221.23.

Use the process above to define the Call Server configuration for the Session Manager if not already defined.

- Ensure that **Call Server** is selected in the **Server Type** drop down menu in the **General** dialogue box (not shown).
- Ensure that the Interworking Profile defined for the Session Manager in **Section 7.4** is selected in the **Interworking Profile** drop down menu in the Advanced dialogue box (not shown).

The following screenshot shows the completed entry for the Session Manager:

BT_Trunk_SBC2	IP Address / FQDN	Port	Transport
	10.10.9.31	5060	ТСР
		Edit	

# 7.6. Define Routing

Routing information is required for routing to BT Global SIP Trunk on the external side and the Session Manager on the internal side. The IP addresses and ports defined here will be used as the destination addresses for signalling.

To define routing to BT Global Service SIP Trunk, navigate to **Global Profiles**  $\rightarrow$  **Routing** in the main menu on the left hand side. Click on **Add** and enter an appropriate name in the dialogue box (not shown), click on Next and enter details for the Routing Profile:

- In the **Load Balancing** drop down menu, select the method of load balancing required. During testing this was set to **Priority**. If an even distribution across the network SBCs is required, **Round Robin** could be used.
- Click on Add to specify an IP address for the first network SBC.
- Assign a priority in the **Priority / Weight** field
- Select the Server Configuration defined in Section 7.5 in the Server Configuration drop down menu. This automatically populates the Next Hop Address field
- Repeat for the alternative network SBC. Click Finish.

Repeat the above process for the Routing Profile for the Session Manager:

	Profile : LAN - Edit F	Rule	X
URI Group	* •	Time of Day	default 🗸
Load Balancing	Priority V	NAPTR	
Transport	None 🗸	Next Hop Priority	$\checkmark$

			Add
Priority / Weight Server Configuration	Next Hop Address	_	Transport
1 CPE	✓ 10.10.9.31:5060 (TC	CP) 🗸	None V Delete
	Finish		

Solution & Interoperability Test Lab Application Notes ©2015 Avaya Inc. All Rights Reserved.

# 7.7. Topology Hiding

Topology hiding is used to hide local information such as private IP addresses and local domain names. The local information can be overwritten with a domain name or IP addresses. The default **Replace Action** is **Auto**, this replaces local information with IP addresses, generally the next hop or external interfaces. Topology hiding has the advantage of presenting single Via and Record-Route headers externally where multiple headers may be received from the enterprise, particularly from the Session Manager. In some cases where Topology Hiding can't be applied, in particular the Contact header, IP addresses are translated to the Avaya SBCE external addresses using NAT.

To define Topology Hiding for BT Global Service SIP Trunk, navigate to **Global Profiles** → **Topology Hiding** in the main menu on the left hand side. Click on **Add** and enter details in the **Topology Hiding Profile** pop-up menu (not shown).

- In the **Profile Name** field enter a descriptive name for BT Global Service SIP Trunk and click **Next**.
- Click on Add Header and select from the Header drop down menu.
- Select IP or IP/Domain from the Criteria drop down menu depending on requirements.
- Leave the **Replace Action** at the default value of **Auto** unless a specific domain name is required. In this case, select **Overwrite** and define a domain name in the **Overwrite Value** field.

Topology Hiding Profiles: BT							
Add				Rename Clone Delete			
Topology Hiding Profiles		Clic	k here to add a description.				
default	Topology Hiding						
cisco_th_profile	Header	Criteria	Replace Action	Overwrite Value			
ASM	Request-Line	IP/Domain	Auto				
BT	From	IP	Auto				
	Referred-By	IP	Auto				
	Record-Route	IP/Domain	Auto				
	Via	IP/Domain	Auto				
	SDP	IP	Auto				
	То	IP/Domain	Auto				
	Refer-To	IP/Domain	Auto				
			Edit				

• Topology hiding was defined for all headers where the function is available.

To define Topology hiding for the Session Manager, follow the same process. This can be simplified by cloning the profile defined for BT Global Service SIP Trunk. Do this by highlighting the profile defined for the Session Manager and clicking on **Clone**. Enter an appropriate name for the Session Manager and click on Next. Make any changes where required, in the test environment the settings were left at the same values.

## 7.8. Server Flows

Server Flows combine the previously defined profiles into two End Point Server Flows, one for BT Global Services SIP Trunk and another for the Session Manager. This configuration ties all the previously entered information together so that calls can be routed from the Session Manager to BT Global Services SIP Trunk and vice versa.

To define a Server Flow for the BT Global Services SIP Trunk, navigate to **Device Specific** Settings  $\rightarrow$  End Point Flows.

- Click on the **Server Flows** tab.
- Select **Add Flow** and enter details in the pop-up menu.
- In the **Name** field enter a descriptive name for the server flow for BT Global Services SIP Trunk, in the test environment **BT\_Trunk** was used.
- In the **Received Interface** drop-down menu, select the internal SIP signalling interface defined in **Section 7.3**. This is the interface that signalling bound for the BT SIP Trunk is received on.
- In the **Signaling Interface** drop-down menu, select the external SIP signalling interface defined in **Section 7.3**. This is the interface that signalling bound for BT SIP Trunk is sent on.
- In the **Media Interface** drop-down menu, select the external media interface defined in **Section 7.3**. This is the interface that media bound for BT SIP Trunk is sent on.
- In the **Routing Profile** drop-down menu, select the routing profile of the Session Manager defined in **Section 7.6**.
- In the **Topology Hiding Profile** drop-down menu, select the topology hiding profile of the BT SIP Trunk defined in **Section 7.7** and click **Finish**.

	Edit Flow: BT_Trunk X

	Finish

To define a Server Flow for the Session Manager, navigate to **Device Specific Settings**  $\rightarrow$  End **Point Flows**.

- Click on the **Server Flows** tab.
- Select **Add Flow** and enter details in the pop-up menu.
- In the **Name** field enter a descriptive name for the server flow for the Session Manager, in the test environment **CPE** was used.
- In the **Received Interface** drop-down menu, select the external SIP signalling interface defined in **Section 7.3**. This is the interface that signalling bound for the Session Manager is received on.
- In the **Signaling Interface** drop-down menu, select the internal SIP signalling interface defined in **Section 7.3**. This is the interface that signalling bound for the Session Manager is sent on.
- In the **Media Interface** drop-down menu, select the internal media interface defined in **Section 7.3**. This is the interface that media bound for the Session Manager is sent on.
- In the **Routing Profile** drop-down menu, select the routing profile of BT SIP Trunk defined in **Section 7.6**.
- In the **Topology Hiding Profile** drop-down menu, select the topology hiding profile of the Session Manager defined in **Section 7.7** and click **Finish**.

# 8. Configure BT SIP Trunk Equipment

The configuration of the BT Global Services equipment used to support the SIP Trunk is outside the scope of these Application Notes and will not be covered. To obtain further information on BT Global Services equipment and system configuration please contact an authorised BT representative.

# 9. Verification Steps

This section provides verification steps that may be performed in the field to verify that the solution is configured properly.

# 9.1. Avaya Communication Server 1000 Verification

This section illustrates sample verifications that may be performed using the Avaya CS1000 Element Manager GUI.

### 9.1.1. IP Network Maintenance and Reports Commands

From Element Manager, navigate to System  $\rightarrow$  IP Network  $\rightarrow$  Maintenance and Reports as shown below. In the resultant screen on the right, click the Gen CMD button.

C	S1000 Eleme	nt Mana <u>c</u>	er		Help   Logout
Managing: <u>192.168.27.3</u> System » I	Username: admin <sup>o</sup> Network » Node Mainte	nance and Repo	rts

### 9.3.2. Verify SIP Entity Link Status

Navigate to **Elements**  $\rightarrow$  **Session Manager**  $\rightarrow$  **System Status**  $\rightarrow$  **SIP Entity Monitoring** (not shown) to view more detailed status information for one of the SIP Entity Links. Select the SIP Entity for CS1000 from the **All Monitored SIP Entities** table (not shown) to open the **SIP Entity, Entity Link Connection Status** page.

Items Refresh							Filter: En
Session Manager	Туре				tored Entities	-	
		Down	Partially Up	Up	Not Monitored	Deny	Total
Session Manager	Core	0	0	5	0	0	5

Verify the status of the SIP link is up between Session Manager and CS1000 by going through the same process as outlined above but selecting the SIP Entity for the Avaya SBCE in the **All Monitored SIP Entities:** table.

Summary View				Status Details for i	he selected Session I	lanager:	
1 Items   Refresh							Filter: Ena
Session Manager Name	SIP Entity Resolved IP	Port	Proto.	Deny	Conn. Status	Reason Code	Link Status
Session Manager	10.10.9.21	5060	TCP	FALSE	UP	200 OK	UP

### 9.3.3. Verify Avaya Aura® Session Manager Instance

The creation of a Session Manager Instance provides the linkage between System Manager and Session Manager. This was most likely done as part of the initial Session Manager installation. To add a Session Manager, navigate to **Elements**  $\rightarrow$  **Session Manager**  $\rightarrow$  **Session Manager Administration** in the left-hand navigation pane and click on the **New** button in the right pane (not shown). If Session Manager instance already exists, click **View** (not shown) to view the configuration. Enter/verify the data as described below and shown in the following screen:

In the **General** section, enter the following values:

•	SIP Entity Name:	Select the SIP Entity created for Session
		Manager
٠	Description:	Add a brief description (optional)
٠	Management Access Point Host Name/IP:	Enter the IP address of Session Manager
		management interface

The following screen shows Session Manager values used for the compliance test.

me / Elements / Session Manager / Session Manager Administr	tion	Help ?

### 9.4.2. Trace Settings

The Trace Settings tool is for configuring and displaying call traces and packet captures for the Avaya SBCE.

To define the trace, navigate to **Device Specific Settings**  $\rightarrow$  **Advanced Options**  $\rightarrow$  **Troubleshooting**  $\rightarrow$  **Trace** in the main menu on the left hand side and select the **Packet Capture** tab.

- Select the SIP Trunk interface from the **Interface** drop down menu
- Select the signalling interface IP address from the Local Address drop down menu
- Enter the IP address of the network SBC in the **Remote Address** field or enter a \* to capture all traffic
- Specify the Maximum Number of Packets to Capture, 10000 is shown as an example
- Specify the filename of the resultant pcap file in the **Capture Filename** field

To view the trace, select the **Captures** tab and click on the relevant filename in the list of traces.

Trace: GSSCP_0	3			
Devices G\$\$CP_03	Packet Capture Captures			Refresh
	File Name	File Size (bytes)	Last Modified	
	Test_20151209042456.pcap	0	December 9, 2015 4:24:56 AM CST	Delete

The trace is viewed as a standard pcap file in Wireshark. If the SIP trunk is working correctly, a SIP response in the form of a 200 OK will be seen from the BT Global Services network.

# 10. Conclusion

These Application Notes describe the configuration necessary to connect Avaya Aura® Communication Server R7.65, Avaya Aura® Session Manager R7.0 and Avaya Session Border Controller for Enterprise R7.0 to BT Global Services SIP Trunk. BT Global Services SIP Trunk is a SIP-based Voice over IP solution providing businesses a flexible, cost-saving alternative to traditional hardwired telephony trunks. The service was successfully tested with a number of observations listed in **Section 2.2**. At the time of writing, an ongoing issue remains with loss of media after 30 minutes on long duration calls. This is under investigation.
